

Business Orbit

A step-by-step guide for everyone who uses it

This guide follows a brand new Business Orbit from the moment it is switched on: an empty system with one administrator, built up until work is flowing through it. Every screenshot is the real product, in the order you will meet it.

Three parts, one for each kind of person

Part 1 is for the administrator who sets the organisation up. **Part 2** is for anyone doing the work. **Part 3** is for whoever keeps an eye on it. Read your own part; it is the only one you need.

What Business Orbit is for

The idea, in one page.

Most work inside a company moves by somebody remembering to chase it. A proposal is written, and then somebody has to remember to ask for a review. The review happens, and somebody has to remember to send it to the client. When a person is busy or away, the work stops and nobody notices until it is late.

Business Orbit is where you write the process down once, and the platform does the chasing. You describe the steps in order, say which kind of person does each one, and from then on every run of that process follows it. When somebody finishes their step, the next step appears on the right person's screen by itself.

The one idea worth holding on to

A **workflow** is the recipe. A **run** is one use of it. You write the recipe once, and start a run every time that piece of work comes up.

The three kinds of account

Everybody signs in to the same place and sees only what belongs to them. The difference is how much of the organisation they can see and change.

Account	What they see	What they can do
Employee	My Work — their own tasks, and nothing else.	Do the steps assigned to them, raise new work, comment, upload files.
Manager	Their own work, plus the Board and the Overview across everybody.	Everything an employee can, plus approve steps, reassign work and read the reports.
Administrator	All of the above, plus Workflows and Admin.	Add people, create roles, build and publish workflows, set passwords.

An access level is not the same thing as a job. Somebody can be an employee who holds three workflow roles, or an administrator who holds none. The two are set separately.

Part 1 — Administrator

Setting up a brand new Business Orbit, from nothing.

When Business Orbit is first switched on it contains one person: you. There are no colleagues, no roles and no processes. This part walks through the four things that turn that into a working system. It takes about twenty minutes.

Step 1 — Sign in

Open the address you were given and sign in with the email and password you were sent. There is no sign-up page on purpose: accounts are created for people, never by them.

The sign-in page. Everybody starts here.

Step 2 — Read the checklist

The first thing you see is your own work — empty, because nothing has been set up yet. Above it is **Getting started**: four steps, in order, with the next one marked. Each step unlocks the one below it, because each genuinely depends on the last. The panel disappears on its own once all four are done.

The setup checklist on a brand new system. Only the first step is available.

Step 3 — Add the people

Go to **Admin**. A workflow hands work to a person, so on your own there is nobody for it to reach — this is why it comes first. Press **Add a person** and fill in their name, email and a starting password.

- 1 Choose their **access level**: Employee for most people, Manager for anyone who needs to see across the team, Administrator only for those who set the system up.
- 2 Set a starting password and tell them out of band — a message, not an email from the system. They can change it themselves from their profile afterwards.
- 3 Phone, joining date, department and team are optional. You can add them later.

Administration

People, workflow roles, and the organisation structure behind them.

People 1

Workflow roles decide what work reaches somebody. Their access level, shown beside their name, decides what they can see and change. The two are independent: an employee can hold three roles, and an administrator can hold none.

Name	Email
Meera Nair	meera@businessorbit.in
Starting password	Access level
*****	Manager — the team's work too
Phone (optional)	Joining date (optional)
+91 98200 11223	05-01-2026
Photo URL (optional)	
https://...	
Department	Team
Not set	Not set
Workflow roles — what work reaches them	
Add person Cancel	

Adding somebody. Only the name, email and password are required.

Step 4 — Create the roles

This is the step people skip, and the one that makes everything else work. A stage of a workflow is never assigned to a person — it is assigned to a **role**, like Content Writer or Editor. The role is then held by whoever currently does that job.

Why it is worth the extra step

When somebody leaves or goes on holiday, you move the role to somebody else and every workflow follows automatically. Nothing has to be edited and no running work breaks. If stages named people instead, you would be editing every process by hand.

Workflow roles 0

What a stage is assigned to, and who currently holds it. The key is derived from the name and never changes, because templates refer to it.

No role yet.

New role

Content Writer	Add role
Writes the first draft	

A role with nobody active in it will stall any workflow routing to it.

Workflows 0

Edit these in the Workflow Builder. A published version is immutable; editing creates the next one.

Creating a role. The name is all it needs.

Step 5 — Give people their roles

Back in the list of people, open somebody and tick the roles they hold, then press **Save roles**. Until a role has somebody active in it, any workflow routing work there will stall — so Business Orbit marks people with no roles in red until you do this.

People 3

Workflow roles decide what work reaches somebody. Their access level, shown beside their name, decides what they can see and change. The two are independent: an employee can hold three roles, and an administrator can hold none.

write_draft

Used by routing. Avoid changing it once work has run.

Instructions

Write the post and paste it in. The editor reviews it next.

Shown to whoever the stage is assigned to.

Who does this stage

A stage goes to everyone these add up to.

Add

Whoever holds a role

Content Writer

Remove

A three-stage process: write, review, publish. The review stage is an approval, so it offers Approve and Send back.

Step 7 — Publish it

Press **Publish**. Business Orbit checks the process holds together first — every stage has somebody to assign it to, every route leads somewhere, every approval says where rejected work goes — and tells you what to fix if not.

Published workflows never change underneath running work

Once published, a version is fixed. Editing it creates version 2, and anything already running stays on the version it started with. Nobody ever has the process change halfway through their job.

Version 1 is live. Work can now be started on it.

Part 2 — Doing the work

For everybody. This is the part most people will only ever need.

If you are not setting the system up, this is your whole guide. There is one screen that matters, and it tells you what to do next.

Step 1 — My Work

When you sign in you land on **My Work**. It shows what is waiting on you and nothing else. If it is empty, you genuinely have nothing to do — you do not need to check anywhere else, and you will be told when something arrives.

Business Orbit — user guide

8

An employee with nothing waiting. The tabs sort your work by when it is needed.

Step 2 — Raise a piece of work

Press **Start a workflow**, choose the process and give this particular run a name — the client, the episode, the article. That name is how everybody will recognise it.

Starting one run of the Blog Post process.

Step 3 — Do your step

The task page tells you what is needed and nothing more. At the top, where this run has got to. On the left, what to do and what to record. On the right, files, comments, and the full history of who did what.

- 1 Fields marked with a red asterisk have to be filled in before you can finish.
- 2 **Save progress** keeps what you have typed without handing the work on. Use it freely.
- 3 The line above the button tells you where the work goes next, and who gets it.
- 4 If you are stuck waiting on somebody else, **Put this on hold** says so publicly rather than letting it look late.

The screenshot shows the 'Business Orbit' interface. At the top, there's a header with the Business Orbit logo, a search bar, and user information for Rohan Das. Below the header, the 'My Work' section is active. The main task is 'Write the draft' for 'How we choose a CRM'. The task is assigned to the user and is in the 'Write the draft' stage of a 3-stage process. The task is due on 30 Sept and is not started. The task description is 'How we choose a CRM - Website Content - Blog Post'. The task is assigned to the user with ID BO-INS-00001. The task has three stages: 'Write the draft', 'Review', and 'Publish'. The 'Write the draft' stage is currently active. The task has a 'What you need to do' section with the instruction 'Write the post and paste it in. The editor reviews it next.' and a 'What you need to record' section with fields for 'Headline' and 'The draft'. On the right, there is a 'Files' section with a 'Put this on hold' button and a 'Choose File' button. The 'Choose File' button is disabled, and the text 'No file chosen' is displayed. The 'Upload file' button is also disabled.

A task, before anything has been entered.

Step 4 — Hand it on

Fill in what is asked and press **Complete**. That is the whole handover. The next stage opens on the right person's My Work immediately, and they are notified. You do not need to tell anybody.

What you need to do

Write the post and paste it in. The editor reviews it next.

What you need to record

Headline *

How we choose a CRM

The draft *

A short guide to picking a CRM without regretting it six months later. We compare three options against what a small team actually needs, and explain the one question that matters most.

If this cannot move

Put this on hold

Files

Nothing has been uploaded to this workflow yet.

Choose File

No file chosen

Upload file

Filled in and ready. The button names the stage you are finishing.

If something is wrong with what you were sent

A reviewer can send work back instead of approving it, with a note saying why. It returns to whoever did that earlier stage, with the note attached. Nothing is lost and nothing is started again from scratch.

Business Orbit — user guide

11

Step 5 — The panels beside your work

The right-hand side of a task page is the same on every stage, and it is where everything that is not a form lives.

- 1 **Files** — anything attached to this run, not just to your stage. Some stages require a file before they can be finished, and say so. Uploading another copy of the same thing keeps both, numbered, rather than overwriting the first.
- 2 **Comments** — a conversation attached to the work rather than to a chat thread. Anybody involved in the run can read it and add to it.
- 3 **Activity history** — who did what, and when. It is added to and never edited, so it is the answer to what actually happened here.
- 4 **If this cannot move** — put the work on hold when you are blocked. That says so publicly, instead of letting it quietly go late.

Step 6 — Being told

You do not have to keep checking. The bell in the header carries a count, and **Notifications** lists what has happened to work you are part of — a stage arriving with you, an approval you asked for, something sent back.

Notifications. The bell in the header carries the unread count.

Step 7 — Your own account

Profile, under your name, is your own summary: what you are carrying, the workflow roles you hold, and what your access level lets you do. It is also where you change your password — do that as soon as somebody sets one up for you.

Changing your password signs you out everywhere else

Every other session is ended, which is the point: if somebody else had the old password, they lose it. You stay signed in where you are.

Work 1

One box for everything. An ID jumps straight to the record.

Part 3 — Keeping it moving

For managers and administrators.

A manager does everything in Part 2 as well — their own work still arrives on My Work. What they have in addition is a view across everybody, and the ability to unstick things.

Approving somebody's work

An approval stage arrives on your My Work like any other task. Open it, read what was done, work through any checklist, then **Approve** to send it on or **Send back** with a note.

Business Orbit — user guide

14

Moving work to somebody else

You can open any run, whether or not it is yours. Opening somebody else's stage says so — you can read it, follow it and comment, but not finish it on their behalf. Looking is not the same as taking over.

When somebody is away or overloaded, press **Reassign**. Each candidate is listed with how much they are already carrying, so the choice is an informed one, and the reason is recorded on the timeline. Below it, **Cancel this workflow** stops a run that should not continue at all — it ends the whole run rather than this one stage, and the history stays readable afterwards.

This moves one task, not the role

Reassigning affects that single piece of work. The stage still points at the role it was configured with, so the next run goes to whoever holds that role. To change it for good, move the role in Admin instead — that is what roles are for.

The screenshot shows the Business Orbit interface. At the top, there's a header with the Business Orbit logo, a search bar, and user information (Meera Nair, Sign out). Below the header, there's a navigation bar with 'My Work', 'Board', and 'Overview'. The main content area shows a task titled 'Write the draft' under the case study 'Ridgeline Foods'. The task is assigned to Rohan Das. A progress bar indicates 'Stage 1 of 3' and '0 of 3 complete'. Below the progress bar, there's a section titled 'What you need to do' with instructions: 'Write the post and paste it in. The editor reviews it next.' To the right, there's an 'Assignment' panel showing a list of users: Meera Nair (1 open), Nitin (0 open), and Rohan Das (1 open). Rohan Das is selected. Below the list, there's a 'Why' section with a text input field containing 'On leave, workload, handover...'. A 'Reassign task' button is visible. At the bottom, there's a section titled 'If this cannot move' with a 'Cancel this workflow' button.

A manager opening a stage somebody else holds. Note the short navigation: no Workflows, no Admin. They can move it on or call the run off, but not finish it.

The Overview — what is happening right now

Overview answers four questions, one per tab. **Now** is the state of play: what is running, what needs a decision, what is late, and who is carrying how much.

Business Orbit — user guide

16

The Board — work as a pipeline

Board lays a workflow out left to right, one column per stage, one card per run. You can see at a glance where everything has got to. Stages with nothing in them fold away to a narrow strip so the board always fits the screen.

Drag a card you hold onto the next column to complete that stage. Cards on somebody else's stage are marked with a padlock and stay put — the board is a faster way to do the same thing, never a way around the process.

Three runs of Blog Post. Empty stages are folded to the left.

The Team — who is carrying what

Team is one row per person: how much they have open, how much is due today, what is overdue, and what is waiting on their approval. Anyone carrying overdue work appears first.

Workload across everybody. Click a name to see their work.

Projects — one initiative at a time

A **Major Project** groups runs that belong to the same initiative, and gives it its own colour so work from several shows apart on a shared screen. Its page is the same questions asked of one project only.

The screenshot shows the 'Business Orbit' interface. At the top, there's a navigation bar with 'My Work', 'Board', and 'Overview' (selected). A search bar is present. The main header shows 'Projects / Website Content' and 'Website Content' with a subtitle 'Everything published on the site' and 'Team:'. Below this, there are three summary cards: 'Active workflows' with a value of 2, 'Overdue' with a value of 0, and 'Completed' with a value of 1. At the bottom, a section titled 'Active workflows 2' is partially visible.

One project: what is running inside it, and what has finished.

The Reports — how long things really take

Reports is the one that changes how you work. **Where the time goes** lists every stage slowest first, with how often it is sent back for changes. That is where a process is worth fixing.

The screenshot shows the 'Business Orbit' interface with the 'Reports' tab selected. The main header shows 'Now', 'Projects', 'Team', and 'Reports' (selected). Below this, there's a 'Reports' section with a subtitle 'Last 30 days - since 29 Aug'. There are filters for 'Last 7 days', 'Last 30 days' (selected), 'Last 90 days', 'All time', and an 'Export CSV' button. The main content area has four summary cards: 'Started' with a value of 3, 'Completed' with a value of 1, 'Still running' with a value of 2, and 'Sent back for changes' with a value of 0. Below these, there are two larger cards: 'Median time to complete' showing '8m' (with a subtitle 'From the request being raised to the work finishing.') and 'Finished on time' showing '100%' (with a subtitle 'Counted only when every stage met its deadline.'). At the bottom, a section titled 'Where the time goes 3' is partially visible, with a subtitle 'Slowest stage first. This is where a process is worth changing.'

Slowest stage first. Rework and lateness are counted per stage.

Part 4 — The administrator's other jobs

Occasional, but somebody has to know where they are.

Setting up is the long part and it happens once. These are the things that come up afterwards, a few times a year each.

When somebody joins, leaves or forgets their password

- 1 **Set password** gives somebody a new one when they are locked out. There is no reset email, so this is the way back in. Tell them out of band, and they can change it themselves.
- 2 **Deactivate** is how somebody leaves. Nothing is deleted — their name stays on the history they made — but they cannot sign in, and work stops being routed to them. Their roles are kept as they were and cannot be changed until they are reactivated, so bringing somebody back puts them exactly where they stood.
- 3 Before deactivating, give their roles to whoever is taking over. A role with nobody active in it stalls every workflow that routes to it.
- 4 **Delete** is for somebody who should never have been added — a wrong address, a duplicate, an account nobody used. It only works for a person with no history at all. For anybody who has done or been given work it refuses, says why, and points you at Deactivate.

People 3

Workflow roles decide what work reaches somebody. Their access level, shown beside their name, decides what they can see and change. The two are independent: an employee can hold three roles, and an administrator can hold none.

Add a person

Meera Nair B0-USR-00002 meera@businessorbit.in · Manager > 1 role — Editor	Set password Deactivate Delete	Nitin B0-USR-00001 nitin@businessorbit.in · Admin > No workflow roles	Set password Deactivate
Rohan Das B0-USR-00003 rohan@businessorbit.in · Employee > 1 role — Content Writer	Set password Deactivate Delete		

Departments 0
Delete is refused while anybody or any workflow still points at it. Set it inactive instead to retire it.

Teams 0

Each person carries their roles and three controls. Your own row has no Delete, for the same reason it has no Deactivate.

Somebody left — Deactivate or Delete?

If they ever did any work, Deactivate. Their history has to keep a name on it, and Business Orbit will not let it lose one. Delete is only for an account that was a mistake from the start.

Departments, teams and projects

None of these are required to run work, which is why setting up skips them. They are for grouping: departments and teams describe the organisation, and a **Major Project** groups runs that belong to the same initiative. Nothing here can be deleted while a person or a workflow still points at it — set it

inactive instead, and the history stays readable.

Edit as new version

Version 1

Live

3 stages

2 running on it

A live workflow. Editing it makes version 2, never changes version 1.

Help inside the product

For when this guide is not to hand.

The ? in the header opens **How this works** — the same ideas as this guide, kept beside the product so it cannot drift out of date on somebody's desktop. It also offers a practice run: a sandbox workflow that behaves like a real one and can be thrown away.

The built-in explanation, and the practice run beside it.

The words this guide uses

Six terms, and then you know the whole vocabulary.

Workflow	A process, written down once. Blog Post, Proposal Creation, Client Onboarding. It lists the stages in order and who does each one.
Version	Workflows are numbered. Publishing fixes a version; editing it creates the next one. Work already running stays on the version it started with.
Stage	One step of a workflow. It has somebody responsible, things they must record, and a deadline measured from the moment it opens.
Role	What a stage is assigned to — Content Writer, Editor — rather than a named person. Move the role to somebody else and every workflow follows.
Run	One use of a workflow. 'Pricing page rewrite' is a run of Blog Post. Each run has its own name, its own deadline and its own history.

Task

One stage of one run, sitting with one person. A task is what appears on My Work.

If you remember nothing else

Work arrives on **My Work**. Finish your step and press **Complete**. The next person is told automatically. Everything else in this guide is detail.
